Abstract not available for AT394133B
Abstract of correspondent: **US5020868**

On each side of a drawer is provided a pull-out rail fastened to the drawer and a supporting rail fastened to a furniture body side wall. A closing device pulls the drawer inwardly during a rearward portion of a push-in movement of the drawer into the body of the piece of furniture. The closing device includes a roller mounted on a pivotable lever which is acted upon by a spring. The roller is guided under pressure along a guide path that partly includes double tracks, the roller being guided in one track during an extracting motion and in the other track during the push-in motion.
